

ABOUT ME

I have no life and coding is my hobby — which means I'm way ahead of the curve when it comes to the latest technologies. I design and run AI systems end to end — agent orchestration, local and hosted LLMs, vector memory and the tooling around them — on a decade of full-stack engineering. I own the whole chain: architecture, implementation, deployment, people.

What a company buys is not a pair of hands: a working system, and the infrastructure that keeps delivering it.

AI Stack

Agent orchestration: multi-agent workflows, role-separated sessions, hand-off and routing, machine-readable rule sets every agent obeys, supervised long-running agents, tool registries (MCP)
Memory: shared vector memory across sessions, embedding pipelines, scoped and versioned stores
Models: self-hosted ~30B next to hosted APIs — OpenAI, Anthropic / Claude Code, Hugging Face, LangSmith, Midjourney, Leonardo, ElevenLabs
Modalities: text, image, speech — in and out — plus function calling

AI Solution Architect - Project Owner - CEO

AI Systems & Agent Orchestration

- I build **agentic systems** — several kinds already: a development-agent workspace, voice-to-voice assistants, and single- and multi-purpose agents for policy, document and FAQ work
- An **agent brain** of my own: a local-first memory service that makes a whole fleet of repositories, docs, decisions and session history reliably retrievable for agents, behind one MCP and REST interface
- Agentic workflows that keep running**: multi-agent workspaces with hand-off, state files and machine-readable rules — a **73-repository** estate where every agent obeys the same standards
- RAG end to end**: embedding pipelines, vector search and scoped, versioned retrieval over private corpora; self-hosted models next to hosted APIs when cost, latency or data residency demand it
- MCP servers** and agent tooling built to order, plus a two-way speech pipeline. Model building and fine-tuning is knowledge I keep current, as is where the field moves next

Software Architecture & Full-stack Delivery

- Planning and implementing complex system architectures, from data model to deployment
- Front-end: Angular 10-19, TypeScript, RXJS, Material, HTML, SCSS, Tailwind, Unity
- Back-end: NodeJS - TypeScript, MongoDB (+ Atlas), Express, SocketIO, Axios, PDFGen, NodeMailer, FS; Python; C#, Unity (2D, 3D)
- Dynamo** — my own framework family, designed, documented and maintained: a dynamic Angular-Material front-end kit, a NodeTS-MongoDB back end, shared full-stack models and a code-generating CLI
- A unified internal component kit built on top of it, plus several products built and running on that stack

DevOps & Delivery

- Built and operate an in-house CI/CD orchestrator: webhook intake, a coalescing job queue with priority ageing, containerised runners, per-step reporting, encrypted secrets and role-based access. Came from GitHub Actions and still work with it — we moved to our own because we outgrew a hosted CI
- Auto-generated end-to-end test suites from typed form models (Playwright): typed, overridable, diffable, with form-coverage and Core-Web-Vitals diagnostics
- Docker environments with microservice architecture across ~20 services
- Server and network configuration: Windows Server, Apache, Nginx, routing, LAN

Own Products & Research

- Designed and developed multiple products in parallel on my own frameworks: the company site, a project management system, a unified authentication service for all internal services, and a full Dynamo reference architecture
- HeloCia — a free-to-use dating application built for commercial purposes
- Dynamo Builder — a web application that uses Dynamo to plan and build web apps
- WarBots — a released multiplayer Unity game, built to master multiplayer concepts in production conditions — plus search algorithms and a code-sample collection for trainings

FUT.DEV.PRO.

Future Development Program Kft. (FDP) is my company. We build AI systems and the software around them — front-end, back-end and the infrastructure that runs them.

Core stack: TypeScript, NodeJS, Angular, Python, C# and Unity3D, with AI integration as the default rather than an add-on.

Where there is no API, we automate the interface itself — and read back the result.

The goal is simple: make development cheaper and simpler, without the result being cheap.

You can learn more about FDP on:
<https://futdevpro.hu>

DYNAMO

Dynamo is my own framework family: a dynamic set of Angular-Material components on the front end, a NodeTS-MongoDB back end, shared full-stack models and a code-generating CLI.

It roughly halves development time on a new project and keeps the behaviour stable — the advantage is largest where there is no component set to start from. I keep developing it as projects demand.

Dynamo Builder, built on top of it, lets non-developers make the everyday changes themselves — so specialist time goes to the work that actually needs it.

HOW I WORK

Contractor only, through my own company — that is the engagement form, whether the work comes from a client or from a company looking to hire. Project engagements first, short and long alike; a subcontractor arrangement also works.

Full remote, with the usual exceptions: onboarding, getting to know the systems, and consultation with customers.

Flexible conditions, and open to more than a standard week when a delivery needs it. I prefer to be in control of the problems I take on.

Legal & Regulatory Compliance

- I drive compliance for our own products with external counsel: GDPR data-processing and sub-processors, consumer-protection rules, NIS2 scope, Data Act, incident notification
- Terms of service, privacy and cookie notices kept in sync with what the software actually does — retention limits, anonymisation, account deletion
- And the product rules that follow, implemented in code: credit expiry and consumption order, refunds, price correction, authentication and logging requirements

Leadership & Client Work

- Company management and employees; planning, estimating, team and task management (Jira, ClickUp, GitLab, GitHub); code documentation and best-practice standards
- Training Angular: concepts, lecturing, mentoring, reviewing, GIT setup
- Rescued a project that had missed its deadline — joined a junior-only mobile team (Angular + NativeScript), planned and implemented the project-saving changes, and shipped it
- Oversized JavaScript / HTML / CSS project with an international team, under financial regulation
- Whole dynamic front-end systems delivered single-handedly and in teams, under special security standards; a VSCode extension for the team's daily work

Lead Angular Developer

- Front-end architecture and development (Angular 8-10, TypeScript, HTML, SCSS, SVG)
- Lead tasks: front-end architecture with the back-end teams, projection and review of development (GIT, Jira, Azure), design planning with clients
- Big-Data project front-end architecture and development
- Redesign of legacy solutions onto an Angular basis; development and architecture consulting
- Training Angular and front-end development from the basics (HTML, CSS, JS, network basics, REST, GIT)

Work Flow Management System Developer

- Front-end development (Angular 6-8, HTML, CSS, Bootstrap, JavaScript, XML)
- Workforce- and Workflow Management System development, business processes at all levels, plus the development acceptance procedure; Angular training for the team
- Business flow implementation for Hungarian Telekom retail fault handling, and establishing the process itself

Lead Front-End Developer

- Front-end development (Angular 4-6, HTML, SCSS, TypeScript, Material2, JSON, REST)
- Planned, designed and developed the UI of completely new systems
- Assigned and supervised UI development team tasks; training in front-end and Angular
- Meeting customer expectations; UI presentation, release and documentation

Work Flow Management System Developer

- Front-end development (HTML, CSS, Bootstrap, JavaScript, XML)
- Workforce- and Workflow Management System development (block programming); low-level business processes; development acceptance procedure; business flow implementation for Hungarian Telekom retail fault handling

Education

Budapest University Of Technology And Economics

Vörösmarty Mihály High school

Vehicle Engineering – Automation

2013 - 2015
Unfinished (due to bureaucracy)
(Programming: C, C++, C#)

Civil Engineering

2011 - 2012
Unfinished (realized I can do more)

A-level equivalent high school education

2005 - 2009
(In drama department, where I learned to communicate effectively.)
